WHAT

An AI software stack for systematic trading

It **assesses** and **assembles** data and algorithms at a scale so large
it can govern a decentralized fund

WHO

Nicholas Adams Judge, Ph.D.
Founder

A political economist whose dissertation focused on GARCH models and research methodology, Nick has worked full-time in crypto since 2016.

Gina Ackerman
Head of Operations

Gina previously was the Director of External Relations under Jeffrey Sachs at The Earth Institute, focused on growing and leveraging private revenue toward the achievement of the United Nations Millennium Development Goals and to support the ideation of the Global Goals.

Gina holds an MA in Quantitative Studies for Finance from Columbia University.

WHY

The multi-year development cycle of systematic strategies prevents their easy scalability. By creating a system that intelligently takes in **components** of forecasts:

1. The scientific research process is architected towards exponential progress
2. Tasks within that process are rendered so discrete and easily-organized that large, even decentralized, teams can work together effectively

HOW

A binary genetic algorithm (GA) is designed to assess features and algorithms simultaneously while minimizing computational costs. This organizes a constantly-evolving universe that is a scaled version of the scientific research method.

Internal Scalability → Decentralizability

The process is, simply, evolution. If you want to contribute a gene - data or algorithm - to the gene pool, you can. If it is good, it reproduces. If not, it dies.

WHY NOW

This project would not be technologically feasible five years ago.

An indirect outgrowth of Nick's dissertation, finished in 2013, full time work began two years ago. The remaining roadmap is 4-6 months long. Funding is appropriate at this point because efficacy is related to scale.
